Sequence 18, Application US/08096623A
Patent No. 5684238
GENERAL INFORMATION:
APPLICANT: Ausich, Rodney L.
APPLICANT: Prichtelm L.
APPLICANT: Proffitt, John H.
APPLICANT: Proffitt, John H.
APPLICANT: Yarger, James G.
APPLICANT: Yen, Huei-Che B.
TITLE OF INVENTION: Biosynthesis of Zeaxanthin and
TITLE OF INVENTION: Glycosylated Zeaxanthin in Genetically Engineered Hosts
NUMBER OF SEQUENCES: 104
CORRESPONDENCE ADDRESS:
ADDRESSER: Weish & Katz, Ltd.
ADDRESSER: Weish & Katz, Ltd.

WPI; 2002-351711/38. N-PSDB; AAD35514 Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon the caroten substrates.

Claim 23; Page 146; 156pp; English.

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopertenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astexanthin, by using microorganism having a nucleic acid molecule encoding enzymes in

Novel isolated mucleic acid useful e.g. to engineer host cells with the ability to produce particular carotenoids and polypeptides useful in cell-free systems to make particular carotenoids.
the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and tragrances and compounds for potential electro-optic applications. The present sequence is Pantoea stewartii beta-carotene hydrolase (CrtZ) enzyme used in the

The present invention describes Pantoea stewartii carotenoid biosynthetic enzymes (I). More specifically described are the geranylgeranyl pyrophosphate synthase (crtE), zeaxanthin glucosyl transferase (crtX), lycopene cyclase (crtE), phytoene desaturase (crtI), phytoene synthase (crtB) and beta-carotene hydroxylase (crtZ) enzymes (see ABP96685 to ABP96690) encoded by ACC44759 to ACC44764. (I) can be used for regulating caroteniom biosynthesis is altered in the organism. (I) and the genes encoding (I) are useful for converting phytoene to the carotenoids, for creating recombinant organisms that have the ability to produce various carotenoid compounds, and also for enhancing or manipulating carotenoid compounds. (I) can also be used for producing gene products having enhanced or altered activity
                                                          120

Sequence 175 AA;

The invention comprises the amino acid and coding sequence of a number of carotenoid (crt)-related proteins. The crt-related DNA and protein sequences of the invention are useful for engineering cells which are able to produce carotenoids. The present amino acid sequence represents a crt-related protein of the invention

The present sequence represents a protein involved in carotenoid adonivation to blosynthesis. The specification describes astaxanthin diglucosides and adonixanthin-3'-glucosides. The specification also describes a method for the preparation of a carotenoid glycoside, in which all, or part of, acoteomoid blosynthesis genes crtE, crtE, crtE, crtE, crtE, crtE, crtE, ortE, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Carotenoid biosynthesis; astaxanthin diglucoside, crtE gene; crtE gene; crtI gene; adonixanthin-3'-glucoside; astaxanthin monoglucoside; carotenoid glycoside; crtY gene; crtZ gene; crtX gene; crtW gene;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  XBXBBXBX
                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                     The invention relates to a method of producing or enhancing production of a carotenoid in a host cell. The method comprises inserting into the cell a vector comprising a hetrologous nucleic acid sequence encoding a protein with epsilon-cyclase enzyme activity operably linked to a promoter, and expressing the heterologous sequence to produce the protein. ABG93886.ABG93914 represent epsilon-cyclase, isopentenyl pyrophosphate isomerase and beta-carotene hydroxylase proteins of the invention. (Updated on 29-AUG-2003 to standardise OS field)

There are a total of six relevant genes in a 7900 bp region that cause B. cals to produce GGPP and the carotemoids phytome through canotemoral part and the final prod. identified in the carotemoid pathway contd. in plasmid paRC376 (conig. a ca. 13 kb carotemoral DNA fragment isolated by Perry et al., U. Bacteriol., 168:607 (1986). The genes for geranylgeranyl pyrophosphate (GGPP) synthase, phytome synthase, phytome dahydrogenase-4H, lycopene cyclase, beta-caroteme hydroxylase, and zeaxanthin glycosylase are represented in AQ13716, AAQ13718, AAQ13722, AAQ13724 and AAQ13726 are specified in third amino acid have been changed from Leu-Val to Val-Leu. Recombinant expression plasmids can be used to produce large amts. of the enzymes and then carotemoids which they synthesise. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Biosynthesis of carotenoid(s) in genetically engineered hosts - using DNA encoding enzymes from Erwinia herbicola.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              64 ALIYPGSTGIWPLOWIGAGMTAYGLLYFMVHDGIVHQRWPRYIPRKGYLKRLYMAHRMH 123

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of producing or enhancing production a carotenoid in a host cell. The method comprises inserting into the ce a vector comprising a heterologous nucleic acid sequence encoding a protein with epsilon-cyclase enzyme activity operably linked to a promoter, and expressing the heterologous sequence to produce the protein. ABC93386-ABG93914 represent epsilon-cyclase, isopentenyl pyrophosphate isomerase and beta-carotene hydroxylase proteins of the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     6 NALIVEVTVVGMEVVAALAHKYIMHGWGWGHHLSHHEPRKGAFEVNDLYAVVFAIVSIAL

                                                                                                                                                                                                                                                    AAR79058-R790629 are xanthophyll polypeptides. These polypeptides are capable of converting the 4-methylene group of a 3-hydroxy-beta-ionone ring to a 4-keto group in doing so these peptides also add a hydroxyl group to the 3-position carbon-atom of the 4-keto-beta-ionone ring. The DNA sequences may be used in the production of astaxanthine and other keto gp. contg. xanthophylls, the sequences may also be used to transform certain yeasts and other microorganisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         67 YPGSTGIWP-LOWIGACMTAYGLLYFWYHDGLVHQRWPFRYIPRKGYLKRLYMAHRMHHA 125

                                                                                                                                                                                                                                                                                                                        셤
                                                                                                 The present sequence represents a protein involved in carotenoid adonixanthes. The specification describes astaxanthin diglucosides and adonixanthin-3'-glucosides. The specification also describes a method for the preparation of a carotenoid glycoside, in which all, or part of, carotenoid biosynthesis genes creB, crtB, crtI, crtY, crtZ, crtX or are introduced to a microbe or plant and expressed. The transformed organism is cultured and astaxanthin diglucosides, adonixanthin-3'-glucosides, and/or astaxanthin monoglucoside are collected. The carotenoid glucosides are used as food additives
                                                                                                                                                                                                                                                                                                                                     67 YFGSTGIWP-LOWIGAGMIAYGLLYFWYHDGLVHQRWPFRYIPRKGYLKRLYMAHRMHHA 125

```
AAR79058-R796629 are xanthophyll polypeptides. These polypeptides are capable of converting the 4-methylene group of a 3-hydroxy-beta-ionone ring to a 4-keto group in doing so these peptides also add a hydroxyl group to the 3-position carbon-atom of the 4-keto-beta-ionone ring. The DNA sequences may be used in the production of astaxanthine and other eterography contg. xanthophylls, the sequences may also be used to transform certain yeasts and other microorganisms. (Updated on 27-AUG-2003 to correct OS field.)

The invention specifically describes the isolation of a 3-bydroxy-3 methylglutaryl coenzyme A (HWG-CoA) reductase protein. This sequence represents the Candida utilis crtZ protein which is used in the method of the invention. (Updated on 17-OCT-2003 to standardise OS field)

The present sequence represents a protein involved in carotenoid biosynthesis. The specification describes astaxanthin diglucosides and adonixanthin-3'-glucosides. The specification also describes a method for the preparation of a carotenoid glycoside, in which all, or part of, carotenoid biosynthesis genes crtE, crtE, crtI, crtY, crtZ, crtX or crtW are introduced to a microbe or plant and expressed. The transformed organism is cultured and astaxanthin diglucosides, adonixanthin-3'-glucosides, and/or astaxanthin monoglucosides, adonixanthin-3'-glucosides are used as food additives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             65 LIYEGSTGIWP--LQWIGAGMTAYGLLYFWVHDGLVHQRWPFRYIPRKGYLKRLYMAHRM 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes the preparation of carotenoid pigments e.g. canthaxanthins using a cell transformed by a vector having DNA sequences (a) to (e) or substantially homologous sequences. (a) a DNA sequence (crtE) coding GGPP synthase of Flavobacterium sp. R.534; (b) a DNA sequence (crtI) coding prephytoene synthase of Flavobacterium sp. R.534; (c) a DNA sequence (crtI) coding phytoene desaturase of Flavobacterium sp. R.534; (d) a DNA sequence (crtY) coding lycopene cyclase of Plavobacterium sp. R.534, and (e) a DNA sequence (crtV) coding lycopene cyclase of Plavobacterium sp. R.534, and (e) a DNA sequence (crtV) coding lycopene cyclase of Plavobacterium sp. R.534, and sequence (crtV) coding lycopene cyclase of Plavobacterium sp. R.534, and sequence (crtV) coding lycopene cyclase of carotenoid mixture can also be used in preparation of food products.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a fusion between the SSU leader and a beta-carotene hydroxylase encoded by the crtZ gene (see AAX25067) of A. auriantiacum. The xanthophyll content of seeds can be altered by transforming cells of a host plant with at least one construct containing: (i) a transcription initiation region of a gene that is preferentially expressed in seeds; (ii) the sequence for a plastid transit peptide, (iii) bNA from a carotenoid synthesis gene coding region, and (iv) a transcription terminacor. The transformed cells are seeds. The method is especially used to increase the carotenoid content in oilseed plants. Coexpression of beta-carotene hydroxylase and beta-carotene ketolase (see AAWSSIO8) results in increased astaxanthin and zeaxanthin content in the seeds of transformed plants
                                                                                                                                                                                                                                                                Btea-carctene hydroxylase: crt2 gene; carotenoid; xanthophyll; pigment;
astaxanthin; zeaxanthin; transgenic plant; oilseed plant; seed oil;
A. auriantiacum.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 phytoene.
PATHWAY: Carotenoid biosynthesis.
SIMILARITY: Belongs to the phytoene/squalene synthetase family.

    .!- ČAŤALYTIC ACTIVITY: 2 geranylgeranyl diphosphate = diphosphate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Proc.
